(8:08 a.m.)

**Call to Order**

DR. SAMET: Good morning. We'll get started. I'm Jon Samet, the chair of the Tobacco Products Scientific Advisory Committee. I want to make a few statements, and then we'll introduce the committee.

For topics such as those being discussed at today's meeting, there are often a variety of opinions, some of which are quite strongly held. Our goal is that today's meeting will be a fair and open forum for discussion of these issues and that individuals can express their views without interruption. Thus as a gentle reminder, individuals will be allowed to speak into the record only if recognized by the chair. We look forward to a productive meeting.

In the spirit of the Federal Advisory Committee Act and the Government in the Sunshine Act, we ask that the advisory committee members take care that their conversations about the topics

1 at hand take place in the open forum of the  
2 meeting. We are aware that members of the media  
3 are anxious to speak with the FDA about these  
4 proceedings. However, FDA will refrain from  
5 discussing the details of this meeting with the  
6 media until its conclusion. Also, the committee is  
7 reminded to please refrain from discussing the  
8 meeting topics during breaks. Thank you.

9 Caryn.

10 **Conflict of Interest Statement**

11 MS. COHEN: The Food and Drug Administration  
12 is convening today's meeting of the Tobacco  
13 Products Scientific Advisory Committee under the  
14 authority of the Federal Advisory Committee Act of  
15 1972. With the exception of the industry  
16 representatives, all members and non-voting members  
17 are special government employees or regular federal  
18 employees from other agencies and are subject to  
19 federal conflict of interest laws and regulations.

20 The following information on the status of  
21 this committee's compliance with federal ethics and  
22 conflict of interest laws, covered by but not

1 limited to those found at 18 U.S.C. Section 208 and  
2 Section 712 of the Federal Food, Drug and Cosmetic  
3 Act, is being provided to participants in today's  
4 meeting and to the public.

5 The FDA has determined that members of this  
6 committee are in compliance with federal ethics and  
7 conflict of interest laws. Under 18 U.S.C.  
8 Section 208, Congress has authorized FDA to grant  
9 waivers to special government employees and regular  
10 federal employees who have potential financial  
11 conflicts when it is determined that the agency's  
12 need for a particular individual's services  
13 outweighs his or her potential financial conflict  
14 of interest.

15 Under 712 of FD&C Act, Congress has  
16 authorized FDA to grant waivers to special  
17 government employees and regular federal employees  
18 with potential financial conflicts when necessary  
19 to afford the committee essential expertise.  
20 Related to the discussion of today's meeting,  
21 members of today's meeting have been screened for  
22 potential financial conflicts of interest of their

1 own as well as those imputed to them, including  
2 those of their spouses or minor children and, for  
3 purposes of 18 U.S.C. Section 208, their employers.  
4 These interests may include investments,  
5 consulting, expert witness testimony, contracts,  
6 grants, CRADAs, teaching, speaking, writing,  
7 patents and royalties and primary employment.

8 Today's agenda involves receiving an update  
9 on the Menthol Report Subcommittee and discussing  
10 presentations regarding the data requested by the  
11 committee at the March 30th and 31st, 2010 meeting  
12 of the Tobacco Products Scientific Advisory  
13 Committee. This is a particular matters meeting  
14 during which general issues will be discussed.  
15 Based on the agenda for today's meeting and all  
16 financial interests reported by the committee  
17 members, no conflict of interest waivers have been  
18 issued in connection with this meeting. To ensure  
19 transparency, we encourage all committee members to  
20 disclose any public statements that they have made  
21 concerning the issues before the committee.

22 With respect to FDA's invited industry

1       representatives, we would like to disclose that  
2       Drs. Daniel Heck and John Lauterbach and Mr. Arnold  
3       Hamm are participating in this meeting as non-  
4       voting industry representatives acting on behalf of  
5       the interests of the tobacco manufacturing industry  
6       and the small business tobacco manufacturing  
7       industry and tobacco growers respectively. Their  
8       role at this meeting is to represent these  
9       industries in general and not any particular  
10      company. Dr. Heck is employed by Lorillard Tobacco  
11      Company, Dr. Lauterbach is employed by Lauterbach &  
12      Associates, LLC, and Mr. Hamm is retired.

13             I'd like to ask you to please silence your  
14      cell phones if you have not already done so, and  
15      I'd like to introduce our press contacts, Tesfa  
16      Alexander and Jeffrey Ventura. If you're here,  
17      please stand up. Thank you.

18                     **Introduction of Committee Members**

19             DR. SAMET: Great. Okay. Thank you. Good  
20      morning. And let me now ask the committee to  
21      introduce themselves. Let's start I think with the  
22      phone.

1           Melanie, you're still with us?

2           DR. WAKEFIELD: Yes, Melanie Wakefield,  
3 Cancer Council Victoria in Melbourne, Australia.

4           DR. SAMET: All right. Neal?

5           DR. BENOWITZ: Neal Benowitz, University of  
6 California, San Francisco.

7           DR. SAMET: Okay. Karen, we'll start left.

8           MS. DELEEUEW: Karen DeLeeuw, Colorado  
9 Department of Public Health and Environment.

10          DR. HENNINGFIELD: Jack Henningfield, Pinney  
11 Associates and Johns Hopkins University School of  
12 Medicine.

13          DR. NEZ HENDERSON: Patricia Nez Henderson,  
14 Black Hills Center for American Indian Health.

15          DR. CLANTON: Mark Clanton, representing  
16 pediatrics, public health and oncology.

17          DR. HATSUKAMI: Dorothy Hatsukami from the  
18 University of Minnesota.

19          DR. MCAFEE: Tim McAfee from the Center for  
20 Disease Control.

21          DR. HECK: Dan Heck from Lorillard Tobacco  
22 Company, representing the manufacturers.

1 DR. LAUTERBACH: John Lauterbach,  
2 Lauterbach & Associates, representing small  
3 business tobacco manufacturers.

4 MR. HAMM: Arnold Hamm, representing U.S.  
5 tobacco growers.

6 DR. SAMET: Okay. Thank you. Actually,  
7 when Caryn read the statement, I thought it sounded  
8 like Dan had moved to work for Lauterbach &  
9 Associates.

10 DR. LAUTERBACH: Anytime.

11 DR. SAMET: Okay. Corinne, I think you're  
12 going to move next.

13 DR. HUSTEN: Corinne Husten, Center for  
14 Tobacco Products.

15 DR. ASHLEY: David Ashley, Center for  
16 Tobacco Products.

17 DR. DEYTON: And Lawrence Deyton, Center for  
18 Tobacco Products.

19 **FDA Presentation: The Menthol Report**

20 DR. HUSTEN: The subcommittee and working  
21 groups have completed their drafting of the TPSAC  
22 report on the public health impact of menthol

1 cigarettes. The chapters of the report are being  
2 posted to the FDA website; a redacted hard copy of  
3 the chapters will be available shortly in a binder  
4 at the table just outside the meeting room. We've  
5 made copies of the chapters available for the  
6 participants at the table. Unredacted copies of  
7 the draft report were distributed electronically to  
8 the TPSAC voting members early this morning for  
9 their review. Redacted versions were sent to the  
10 industry representatives as soon as the redaction  
11 was completed.

12 It's our understanding that TPSAC plans to  
13 come to closure on the report on the conclusion of  
14 this morning's meeting after deliberating on a  
15 draft report and the recommendations. If there are  
16 substantive changes to the scientific evidence or  
17 chapter conclusions proposed by the committee to  
18 the report that cannot be incorporated into the  
19 document during today's meeting, FDA will be happy  
20 to organize an additional brief public session of  
21 the TPSAC before March 23rd for the committee to  
22 review and discuss the changes made to the report.

1           If after its deliberation, the TPSAC adopts  
2     the draft report, it will be considered submitted  
3     to FDA. After submission, no substantive changes  
4     in scientific findings, conclusions or  
5     recommendations will be made to the report.

6     Clerical support has been provided to the committee  
7     for assistance in proofreading and formatting of  
8     the document, including incorporating verbatim the  
9     TPSAC recommendations into the final report. The  
10    submitted TPSAC report will be reviewed again by  
11    FDA staff to ensure that decisions about current  
12    redaction of trade secret and commercial  
13    confidential information are correct. At that  
14    time, the final report of the full committee will  
15    be posted on the FDA website.

16           DR. SAMET: Thank you.

17           So our task this morning is to complete our  
18    discussion of the chapters of the report, including  
19    of course chapter 8, which provides our answers to  
20    the seven questions listed here as well as the two  
21    additional questions at the population level, our  
22    overall findings and recommendations as well as

1 discussion of some additional issues.

2 I think what we'll do is return first to  
3 discussion of chapter 6, which has now been brought  
4 to completion. And, Dorothy, I'll turn to you to  
5 take the lead.

6 DR. HATUSKMI: So basically, as I mentioned  
7 before yesterday, there are three areas that we  
8 examined. One was initiation and experimentation.  
9 And within that area, we were asked to answer the  
10 question is there evidence to indicate that the  
11 availability of menthol cigarettes increases the  
12 likelihood of experimentation and initiation.

13 To take a look at that issue, what we wanted  
14 to do is take a look at the proportion of menthol  
15 users across the age spectrum. And what we had  
16 observed was that there were considerably a higher  
17 number of younger population of smokers compared to  
18 the older population of smokers that smoke menthol  
19 cigarettes among smokers. The only exception was  
20 African Americans for whom the rates were high  
21 during adolescence as well as during the older age.

22 We also looked at the portion of adolescent

1 smokers who smoked menthol cigarettes among the  
2 population of youth smokers. And even within that  
3 particular population, we found evidence that was  
4 sufficient to conclude that the rate of menthol  
5 users are highest among the younger users and then  
6 decreases over age.

7 The second evidence that we looked at was  
8 the trend of menthol use among the adolescent  
9 population, and what we observed is that there is  
10 an increasing trend of menthol cigarette smoking  
11 among the youth. And this coincides with the  
12 decreasing trend of non-menthol cigarette use among  
13 the adolescent smokers. And so we were  
14 particularly concerned about this trend.

15 We addressed the issue of the fact that  
16 cigarette smoking is becoming less prevalent among  
17 the adolescents. This was raised by some of the  
18 members of the tobacco company, but we believed  
19 that there is sufficient evidence to conclude that  
20 menthol cigarettes is declining at a slower rate  
21 than non-menthol cigarette smoking.

22 We looked at the proportion of adolescent

1 smokers who smoke menthol among the less  
2 established smokers, and that was defined as  
3 smoking for less than one year and compared it to  
4 more established smokers; that is, smoking for  
5 greater than one year. And we found that there  
6 were a higher number of adolescent smokers who  
7 smoked menthol cigarettes among those who were less  
8 established smokers compared to more established  
9 smokers, meaning that the less experienced  
10 adolescent smokers may, in fact, be experimenting  
11 with menthol cigarettes.

12 We looked at the age of initiation of  
13 menthol versus non-menthol cigarettes, and we found  
14 that there were no differences in terms of the age  
15 of initiation. However, we did find one study that  
16 was conducted by Curtin et al. from RJR that showed  
17 that adolescents tended to smoke at an earlier age.

18 We also found evidence based on concordant  
19 findings from studies of internal tobacco industry  
20 documents. So these were studies that were  
21 conducted by independent investigators that the  
22 tobacco companies were aware of the appeal of

1 menthol cigarettes to younger novice smokers  
2 because these cigarettes were indeed easier to  
3 smoke, which coincides with the biological  
4 plausibility that was found in chapter 3.

5           So the other area that we addressed was  
6 addiction, and the first question that we addressed  
7 was does the availability of menthol cigarettes  
8 increase the likelihood of becoming addicted? And  
9 to date, there's been one unpublished secondary  
10 analysis that has addressed this issue in a sample  
11 of adolescent students who were assessed from  
12 different regions of the country, the U.S. And  
13 this study strongly suggests that menthol  
14 cigarettes are associated with increased transition  
15 to greater or established smoking and dependence.

16           The second issue that we addressed in the  
17 addiction was does the inclusion of menthol in  
18 cigarettes increase the degree of addiction in  
19 smokers compared to non-smokers. So we looked at a  
20 number of areas to address this issue. Among the  
21 adult studies, we looked at the pharmacokinetics of  
22 nicotine.

1           We've looked at abuse liability studies,  
2   cigarette smoked per day, exposure to nicotine in  
3   general, exposure to nicotine per cigarette, as  
4   well as subjective measures of dependence. And  
5   like Dr. Heck's report, we found that among adults,  
6   there isn't any evidence to support that adults are  
7   more addicted to menthol cigarettes compared to  
8   those who smoke non-menthol cigarettes. However,  
9   we did take a look at a body of literature related  
10   to adolescents, and we felt that there was enough  
11   evidence to conclude that among the adolescent  
12   population, that they tend to experience not only a  
13   higher prevalence of addiction but also more severe  
14   addiction than among non-menthol smokers. And this  
15   is of concern because this is a population that's  
16   particularly vulnerable to the effects of menthol  
17   cigarette smoking.

18           With regards to the area of cessation, we  
19   did take a look at all the scientific literature,  
20   and you could probably tell by the thickness of the  
21   report. And so we just wanted to make sure that  
22   the FDA had all the information available to them

1 to see how we came to our conclusion. And in the  
2 evaluation of this cessation studies, we more  
3 heavily weighted the population surveys. And the  
4 reason why we did is because the majority of people  
5 that quit smoking, quit smoking on their own. They  
6 don't necessarily enter treatment to quit smoking.  
7 So that's where we put most of the emphasis in  
8 terms of the extent to which we used the evidence  
9 to make our determination.

10 Based upon that particular criteria as well  
11 as other criteria that you will see specified in  
12 the report, we think that there is sufficient  
13 evidence to show that non-white smokers actually  
14 who smoke menthol cigarettes experience more  
15 difficulty quitting than non-white smokers that  
16 smoke non-menthol cigarettes.

17 The information on the whites is mixed, and  
18 unlike the tobacco industry report, we felt that it  
19 was really important to concentrate on looking at  
20 studies that examined the different racial ethnic  
21 groups primarily because certain racial ethnic  
22 groups may in fact have different experiences with

1 menthol cigarettes. And, in part, it was our  
2 charge given - a charge given to TPSAC to take a  
3 look at racial ethnic differences.

4 Now, there were some studies to suggest, as  
5 I had noted in our previous meeting, that the  
6 menthol cigarette smokers tend to be less  
7 responsive to medication. And this we believe is  
8 an area for further exploration. Unfortunately,  
9 there were no studies that have been conducted with  
10 adolescent smokers to compare the differences  
11 between menthol and non-menthol cigarettes on  
12 smoking cessation.

13 Finally, we believe that menthol cigarettes  
14 are marketed toward the African-American population  
15 and the young, and this was pointed out by chapter  
16 5. And this was a real concern to us because these  
17 are often the groups that are at high risk for poor  
18 cessation outcomes. So that was our report.

19 DR. SAMET: Okay. Thank you.

20 Of course, this is a very lengthy chapter.  
21 Just for those of you who may not have it, there  
22 are 49 pages of text as well as extensive

1 supporting tables. So let me open for discussion,  
2 question, comments.

3 Dan.

4 DR. HECK: Just a slight clarification to  
5 the summary. I thought I heard correctly reference  
6 to the industry menthol report not addressing the  
7 cessation studies for specific ethnic  
8 subpopulations. That discussion is in the report.  
9 I'm sorry if it didn't make it or wasn't clear in  
10 the executive summary, so we'll have that next  
11 week.

12 DR. SAMET: Okay. Thank you. And, of  
13 course, we'll look forward to reading the full  
14 report.

15 Let me see. Other questions -- Neal or  
16 Melanie?

17 DR. WAKEFIELD: I don't have any questions,  
18 Jon.

19 DR. BENOWITZ: I don't, either, Jon.

20 DR. SAMET: Okay. Does, again, anyone else  
21 around the table have further questions or comments  
22 on this chapter?

1 [No response.]

2 DR. SAMET: Dorothy?

3 DR. HATSUKAMI: I do want to mention an  
4 erratum. Dr. Heck had yesterday -- when we were  
5 discussing the Nonnemaker article, he had said that  
6 1.68 was not significant, and you're right. And we  
7 did take a look at the population that did not  
8 include wave 3. And I realize the reason why we  
9 did that is because we wanted to be more  
10 conservative in our estimate. If we chose the  
11 significant value, then the odds ratio would have  
12 been much higher. And so we were more conservative  
13 in terms of the estimate. So I apologize for  
14 misleading the committee as well as Dr. Heck.

15 DR. HECK: Yes, as a follow-on to that, I'd  
16 have to look carefully at the calculations because  
17 I'm recalling the calculation comes out to over 100  
18 percent initiation if all the data are included.  
19 So it just seemed to be contrary to common sense,  
20 and we'll have to look carefully at the model,  
21 though, I think.

22 DR. SAMET: Yes, an actual comment, I think

1       this is where the sensitivity analyses that are  
2       provided in the appendix are important so that you  
3       can gauge the consequences of any particular  
4       assumption. Of course, there is an estimate of  
5       1.00 for that particular parameter included for  
6       comparison.

7               Okay. Then I think we're done with  
8       chapter 6. We'll turn to chapter 8, which is the  
9       conclusions and recommendations chapter. And Mark  
10       will lead that discussion.

11                       **Presentation and Discussion of**  
12                       **Final Menthol Report and Recommendations**

13               DR. CLANTON: Thank you.

14               The plan to discuss chapter 8 is as follows.  
15       I'm going to provide an introduction to the  
16       chapter. We're going to review the questions that  
17       were posed on both the population and individual  
18       level. I'll provide the finding for each of these  
19       questions, and then we'll summarize with future  
20       research recommendations and a recommendation to  
21       the FDA.

22               By way of introduction, in this chapter,

1       TPSAC synthesized the evidence included in  
2       chapters 3 to 6 to address the charge given to  
3       TPSAC in the Act. Using the methodology described  
4       in chapter 2, TPSAC has systematically identified  
5       and evaluated relevant studies and other evidence,  
6       including papers published in the peer-reviewed  
7       literature, documents supplied to the committee by  
8       tobacco companies, FDA white papers, and  
9       unpublished tobacco company documents.

10               Here, TPSAC provides its conclusions to the  
11       seven key questions in chapter 1 related to  
12       individual smokers and the two key questions  
13       related to effects at the population level. These  
14       conclusions are expressed in the classification set  
15       out in chapter 2 that is based around the anchoring  
16       point of equipoise in the strength of evidence for  
17       and against a relationship.

18               The answer to these questions underlies  
19       TPSAC's qualitative judgment as to whether there is  
20       an adverse impact on public health from menthol  
21       cigarettes. The results of models are used to  
22       provide a quantitative picture of the adverse

1        impact. Because the answers to questions 1 and 2  
2        utilize the same evidence, these closely-related  
3        questions are answered together. For the same  
4        reason, questions 3 and 4, which are also closely  
5        related, are answered together. Chapter 8 concludes  
6        with recommendations to the FDA and a discussion of  
7        contraband as called for under Section 907(b).

8                Evidence synthesis for key questions.  
9        Questions related to individual smokers. Number 1,  
10       does the availability of menthol cigarettes  
11       increase the likelihood of experimentation? And  
12       question 2, does the availability of menthol  
13       cigarettes increase the likelihood of becoming a  
14       regular smoker?

15                TPSAC finds based its review that the  
16       evidence is sufficient to conclude that a  
17       relationship is more likely than not that the  
18       availability of menthol cigarettes increases  
19       experimentation and regular smoking. In the jargon  
20       and lexicon of equipoise, it is considered above  
21       the equipoise level.

22                Question 3. Does inclusion of menthol in

1 cigarettes increase the likelihood of smokers  
2 becoming addicted? Question 4. Does inclusion of  
3 menthol in cigarettes increase the degree of  
4 addiction of the smoker?

5 Here, TPSAC finds, first, the evidence is  
6 sufficient to conclude that a relationship is more  
7 likely than not that the availability of menthol  
8 cigarettes increases the likelihood of addiction  
9 and the degree of addiction in youth smokers above  
10 equipoise. And there is insufficient evidence to  
11 conclude that menthol cigarettes increased the  
12 likelihood of addiction and the severity of  
13 addiction in adults. The evidence was below  
14 equipoise.

15 Adding additional information for 3 and 4  
16 and the rationale for the conclusion, TPSAC found  
17 clear evidence of a relationship between menthol  
18 cigarettes and nicotine addiction in youth. This  
19 evidence presented in chapters 3 and 6 provide  
20 three key findings. I will mention two of them.

21 Youth who initiate with menthol cigarettes  
22 are more likely to become daily regular or

1 established smokers than youth who initiate with  
2 non-menthol cigarettes. And second, adolescent  
3 menthol cigarette smokers have a higher prevalence  
4 of nicotine dependence and degree of addiction than  
5 in those who smoke non-menthol cigarettes.

6 Question number 5. Are smokers of menthol  
7 cigarettes less likely to quit successfully than  
8 smokers of non-menthol cigarettes? Here, TPSAC has  
9 the following finding.

10 The evidence is sufficient to conclude that  
11 a relationship is more likely than not that the  
12 availability of menthol cigarettes results in lower  
13 likelihood of smoking cessation in African  
14 Americans compared to non-menthol cigarettes. The  
15 evidence was judged to be above equipoise. And 2,  
16 the evidence is sufficient to conclude that a  
17 relationship is as likely as not that the  
18 availability of menthol cigarettes results in lower  
19 likelihood of smoking cessation success in other  
20 racial and ethnic groups. The evidence was judged  
21 to be at the equipoise level, as likely as not.

22 An additional comment here, TPSAC examined

1 data from national population surveys and other  
2 studies to determine the comparative success of  
3 quit attempts among smokers of menthol compared  
4 with non-menthol cigarettes. This information is  
5 summarized in chapter 6.

6           Number 6. Do biomarker studies indicate  
7 that smokers of menthol cigarettes receive greater  
8 doses of harmful agents per cigarette smoked  
9 compared with smokers of non-menthol cigarettes?  
10 Here, TPSAC finds the evidence is insufficient to  
11 conclude that it is more likely than not that  
12 menthol smokers inhale more smoke per cigarette or  
13 that they're exposed to higher levels of nicotine  
14 or other tobacco toxins. The evidence was judged  
15 below equipoise.

16           Number 7. Do smokers of menthol cigarettes  
17 have increased risk for diseases caused by smoking  
18 compared to smokers of non-menthol cigarettes?  
19 Once again, TPSAC finds the evidence is  
20 insufficient to conclude that it is more likely  
21 than not that smokers of menthol cigarettes have  
22 increased risk for disease caused by smoking

1 menthol cigarettes compared to non-menthol  
2 cigarette smokers. The evidence was judged to be  
3 below equipoise.

4 Now on to the two questions that refer to  
5 the population level. Number 1. Does the  
6 availability of menthol cigarettes increase the  
7 prevalence of smoking in the population beyond the  
8 anticipated prevalence if such cigarettes were not  
9 available? The question also asked a similar  
10 question in subgroups within the population.

11 Here, TPSAC finds that the evidence is  
12 sufficient to conclude that it is more likely than  
13 not that the availability of menthol cigarettes  
14 increases the likelihood of experimentation and  
15 regular smoking beyond the anticipated prevalence  
16 if such cigarettes were not available in the  
17 general population and, in particular, available to  
18 African Americans.

19 The evidence is sufficient to conclude that  
20 is more likely than not there is a causal  
21 relationship between the availability of menthol  
22 cigarettes and regular smoking among youth. The

1 evidence was judged to be above equipoise.

2 Moving now to the second question for the  
3 population level, does tobacco company marketing of  
4 menthol cigarettes increase the prevalence of  
5 smoking beyond the anticipated prevalence if such  
6 cigarettes were not available? Also, applied in  
7 the subgroup population.

8 Here, TPSAC found the following three  
9 points. The evidence is sufficient to conclude that  
10 it is more likely than not that menthol cigarette  
11 marketing increases the prevalence of smoking  
12 beyond the anticipated prevalence if such  
13 cigarettes were not available for the whole  
14 population for youth and for African Americans.  
15 The evidence was judged here to be above equipoise.

16 Number 2. The evidence is sufficient to  
17 conclude that it is as likely as not that menthol  
18 cigarettes increase prevalence of smoking beyond  
19 the anticipated prevalence if such cigarettes were  
20 not available. The evidence was judged to be at  
21 equipoise, as likely as not. And lastly, TPSAC  
22 finds the evidence is insufficient to conclude that

1       it is more likely than not that menthol cigarette  
2       marketing increases the prevalence of smoking  
3       beyond the anticipated prevalence if such  
4       cigarettes were not available for Asian Americans,  
5       Hawaiian Pacific Islanders and women. The evidence  
6       was judged to be below equipoise.

7               And now for the overall conclusions. There  
8       were two. First, menthol cigarettes have an  
9       adverse impact on the public health in the United  
10       States. Number 2, there are no public health  
11       benefits of menthol compared to non-menthol  
12       cigarettes.

13               There's a section that then summarizes the  
14       model as it provides wisdom as it relates to the  
15       potential quantitative public health impact of  
16       menthol cigarettes versus non-menthol cigarettes.  
17       That is summarized, and I'm going to read this  
18       portion of the recommendation.

19               "Menthonation of cigarettes was discovered  
20       by accident in 1920. Even then, the sensory and  
21       medicinal properties of menthol were known, and  
22       these properties along with cigarette design and

1 marketing have made menthol cigarettes a  
2 substantial component of the cigarette market in  
3 the United States. In the decades since the first  
4 menthol cigarettes were made, there have been  
5 substantial advances in the understanding of the  
6 pharmacology of menthol, of how to use menthol to  
7 manipulate flavor and the sensory perception of  
8 cigarette smoke and of the interplay between  
9 menthol and nicotine.

10 TPSAC has found that the availability of  
11 menthol cigarettes has an adverse impact on the  
12 public health by increasing the number of smokers  
13 with the resulting premature death and avoidable  
14 mortality."

15 We make the following overall  
16 recommendations. Actually, first, I'm going to  
17 just make a couple of comments about contraband.  
18 As you recall, Section 907(b) requires that the  
19 Secretary pay close attention and make provisions  
20 for issues related to contraband.

21 Our conclusions here are the following:  
22 After reviewing several presentations on contraband

1 and counterfeiting, TPSAC acknowledges that the  
2 potential for contraband menthol cigarettes exist.  
3 Should FDA choose to implement a ban or take some  
4 other policy action that restricts the availability  
5 of menthol cigarettes, consistent with the  
6 requirements of the Act, TPSAC recommends that the  
7 FDA consult with the appropriate experts and carry  
8 out relevant analyses depending on the actions  
9 taken in response to this report from TPSAC. At  
10 present, TPSAC is not constituted to carry out such  
11 analyses, and lacking knowledge of FDA's intent on  
12 the receipt of this report, it concluded that the  
13 FDA would need to assess the potential for  
14 contraband menthol cigarettes as required by the  
15 Act.

16 We have a section on other considerations,  
17 which you can read, and I would like to conclude  
18 with recommendations on future research. In the  
19 course of reviewing the evidence related to its  
20 charge, TPSAC noted gaps in the understanding of  
21 menthol cigarettes and public health that should be  
22 addressed with future research. Here, TPSAC makes

1       brief recommendations with acknowledgement that the  
2       priority given to particular recommendations may  
3       depend on any policy action taken by the FDA.

4               First, on the topic of subliminal menthol,  
5       TPSAC was given the charge of addressing menthol in  
6       cigarettes but, as set out in chapter 1, focused  
7       this report on menthol cigarettes. Several studies  
8       suggest that menthol may be present in some  
9       cigarettes in which it is not a characterizing  
10      additive.

11              TPSAC suggests that future and further  
12      research should be carried out to characterize the  
13      menthol content of cigarettes in general and to  
14      assess whether menthol has pharmacologic effects at  
15      these concentrations that might affect initiation,  
16      dependence and cessation.

17              Next, under the topic of susceptible and  
18      vulnerable populations, TPSAC found little data on  
19      the use of menthol cigarettes by severely ill -- a  
20      population with a high prevalence of cigarette  
21      smoking. This gap should be addressed as should  
22      data gaps for other potentially vulnerable

1 populations. There is now substantial research on  
2 genetic determinants of addiction to nicotine.  
3 Studies on this topic should incorporate  
4 consideration of menthol cigarette smoking in their  
5 protocol.

6 In addition, more research is required to  
7 assess whether menthol interacts with genetically  
8 determined bitterness taste sensitivity such as the  
9 taste sensitivity to PTC, which is  
10 phenylthiocarbamate, or PROP, which is 6-n-  
11 propylthiouracil, to facilitate smoking.

12 Lastly, under the category of strengthen the  
13 evidence foundation on the public health impact of  
14 menthol cigarettes, first, cohort studies of  
15 adolescents and youth adults should be carried that  
16 follow participants from experimentation to  
17 initiation to dependence. These studies would  
18 provide an important understanding of the risk for  
19 moving across this sequence that is associated with  
20 menthol cigarette availability.

21 Number 2. The consequences of menthol  
22 cigarette smoking for likelihood of successful

1       cessation need further investigation in the general  
2       population. Additionally, the implications of  
3       menthol cigarettes for sustained quitting should be  
4       addressed in clinical trials of cessation therapy  
5       as well as other databases.

6               And lastly, we recommend that there should  
7       be developed surveillance protocols to track  
8       industry marketing practices, including price  
9       promotions and their impact on smoking patterns  
10      with attention to menthol cigarettes. The  
11      protocols should be sufficiently fine-grained with  
12      regard to populations and places and focuses on  
13      critical periods of policy implementation.

14             We'll go back to one point. Consequently,  
15      TPSAC makes the following overall recommendation to  
16      the FDA. Removal of menthol cigarettes from the  
17      marketplace would benefit public health in the  
18      United States. The Act offers a variety of  
19      mechanism for the FDA to consider. If it concludes  
20      that it should pursue this recommendation at this  
21      time, TPSAC has no specific suggestions for follow-  
22      up by FDA to the recommendation.

1                                   **Committee Discussion of**  
2                                   **Questions to the Committee**

3                   DR. SAMET:   Okay.   Thank you, Mark.

4                   Now this is open for discussion, and I'd  
5                   particularly like to hear from the member who was  
6                   not in the writing group.   Jack.

7                   DR. HENNINGFIELD:   Just to go to a smaller  
8                   point rather than starting with the big one, before  
9                   this committee started, it had been well accepted  
10                  that menthol smoking initiation led to menthol  
11                  smoking in adults.   I think one of the findings  
12                  that was troubling for me was seeing the data be  
13                  laid out that menthol smoking initiation also led  
14                  to increases in the general population beyond  
15                  menthol smokers, in other words, that there were  
16                  people that started on menthol, then switched to  
17                  non-menthol.   And that means that menthol is  
18                  contributing to overall population prevalence on  
19                  top of menthol smokers and disease in people who  
20                  are not menthol users.

21                  Some people -- and there has been discussion  
22                  of this -- would characterize menthol cigarettes

1       then as a starter product in that sense. The word  
2       "starter product" wasn't used in this report. I  
3       suspect some readers will use that term. What's  
4       your own sense? Is that a term that you think is  
5       appropriate or just a general term that's not  
6       scientific enough or?

7               DR. CLANTON: Well, let me try to respond to  
8       both questions. So first of all, if you just look  
9       at basic switching rates, the switching rate from  
10      menthol to non-menthol is fairly low, in the range  
11      of 5, 6 percent. However, we did find evidence  
12      that those who initiate with menthol, that there  
13      may be as much as a 28 percent switch to a non-  
14      menthol cigarette at some point after they become a  
15      regular smoker. A lot of the switching has to do  
16      with when you're measuring it and what that looks  
17      like. So typically it looks low, but we did have  
18      evidence that as much as almost a third of those  
19      who might initiate with a menthol cigarette at some  
20      point in their adult regular smoking would then go  
21      on to non-menthol cigarettes.

22              So your point is well taken that at least at

1 a third level, we find that there are people who  
2 are starting with menthol and then moving on. We  
3 can probably have further discussion about whether  
4 or not it should be called a starter cigarette.

5 Should it be a third, should we see 50  
6 percent level transitioning to non-menthol, should  
7 it be 75 percent transition, I don't know the  
8 answer. But I can give you quantitatively, it's  
9 about a third, and whether or not it would be  
10 called a starter cigarette is open for discussion.

11 DR. SAMET: I'm going to say, Jack, partly  
12 in response to your comment, it was certainly not a  
13 term that we either considered nor used as the  
14 evidence was being reviewed. I mean, I think the  
15 evidence review was really strictly focused on the  
16 questions. So I think any additional sort of  
17 surmise would lie with those who want to take the  
18 evidence further.

19 Dorothy, did you want to comment?

20 DR. HATSUKAMI: We do talk about the rate of  
21 switching in chapter 6. I just didn't bring it up  
22 in my summary, but Mark has done a good

1       recapitulation of that information.

2               DR. SAMET: Jack, further comments on the  
3       report?

4               DR. HENNINGFIELD: On the general contraband  
5       issue, I think that the report appropriately points  
6       out the limitations of the committee. The report  
7       certainly has listened -- I think it's evident that  
8       the committee has listened and the report addresses  
9       those concerns. And any feeling that they've been  
10      ignored I think is not consistent with the report.

11              I think that the recommendations to FDA as  
12      to things to consider are succinct and appropriate.  
13      I think that FDA might also be looking at countries  
14      and regions in which menthol cigarettes are not  
15      marketed. I'm not sure if they're actually banned  
16      in any of those, but to see -- I'm not aware that  
17      there is a contraband problem in those areas. And  
18      it's something that FDA should look at, because if  
19      there isn't a contraband problem that is major in  
20      regions where it's not marketed or not banned, FDA  
21      might learn from what is happening.

22              Related to that, we know that marketing is

1       important, and so one of the limitations of any  
2       model is a world without or a country without  
3       marketing. So my guess is that the models  
4       underestimate the potential benefits because  
5       marketing would also not be allowed. So that's  
6       something to be looked at.

7               Lastly is the benefits of the education.  
8       And so, for example, when you look at the findings  
9       that have just been discussed and conclusions, if  
10       conclusions such as those were part of an education  
11       program before any action was taken, if an action  
12       was taken and after, those effects would be  
13       expected on the basis of everything we know about  
14       smoking and other drug use to reduce demand. And  
15       so I think FDA when looking at the contraband issue  
16       is going to have to think about not only how do you  
17       reduce the supply but how do you reduce demand.  
18       And I think what's unraveling globally with the  
19       international treaty provides some lessons there as  
20       well.

21               DR. SAMET: I think you captured the general  
22       approach to the contraband issue well. I think we

1        recognized that this was in our charge. We were  
2        certainly reminded of that by public commenters.  
3        We were provided with a number of potential  
4        scenarios of what might follow, based on  
5        necessarily a lack of knowledge of what steps FDA  
6        might take in the future with regard to menthol  
7        cigarettes. And I think that's why we feel that  
8        our job at this point is to call attention of the  
9        FDA to this issue, express the concern, acknowledge  
10       the possibility, and then leave open. Depending,  
11       as you point out, whatever the future actions may  
12       be, the issue would need to receive attention under  
13       the circumstances of those actions.

14                Dan.

15                DR. HECK: I did notice, in just the few  
16       minutes I've had to absorb the concluding chapter  
17       here, some points of agreement between the industry  
18       menthol report and the voting members' report. I  
19       note that these areas of agreement, broad  
20       agreement, tend to come from the areas of the  
21       traditional quantifiable hard sciences and  
22       extending that also to the risk. There doesn't --

1 I think there's broad agreement that menthol  
2 cigarettes don't seem to convey greater individual  
3 risk to the smoker, and the population risk from  
4 epi studies seem to concur with that.

5 I think another point of agreement here in  
6 the research recommendations, they call for  
7 strengthening of evidence in the area of the  
8 transition of smoking experimentation to initiators  
9 of a long-term smoking habit. Particularly, as I  
10 tried to express yesterday, the model presented by  
11 the committee, whether that key figure appears to  
12 be derived from a single study, the Nonnemaker  
13 study, yet unpublished and un-peer reviewed, of a  
14 relatively small adolescent population, just over  
15 100 I believe with, again, around a dozen African  
16 Americans. So I think we do have an acute need to  
17 improve the quality of our knowledge and science of  
18 that particular step or stage of the smoking  
19 initiation process.

20 I think what your points of disagreement  
21 that we have are certainly on these behavioral  
22 areas, some of the initiation, dependence,

1        cessation areas where we're asked to, in effect,  
2        try to infer causation by menthol of these very  
3        complex human behaviors. And in the industry's  
4        view, as I expressed yesterday, and as you'll see  
5        in our report, we don't feel that the science in  
6        those areas is sufficient to support a sound  
7        regulatory science judgment. They may be  
8        unknowable in terms of a single factor such as  
9        preference for menthol in terms of a causal role.

10                So I think that's a point of disagreement  
11        between the two reports, but FDA will have the  
12        opportunity to consider both and consider the  
13        additional evidence that's coming into the  
14        literature going forward.

15                DR. SAMET: Thank you, Dan. I think all of  
16        us here have taken a close look at the large  
17        literature and recognize its complexities. And I  
18        think certainly TPSAC has worked very hard to try  
19        and understand the main findings and the level of  
20        evidence across this body of literature, as you and  
21        your colleagues have. And you are correct; these  
22        reports and whatever other reports may be submitted

1 to FDA will be considered by them.

2 Let me see. We have Melanie and Neal on the  
3 phone, and if either of you are awake and want to  
4 comment, now would be a good time.

5 DR. WAKEFIELD: It's Melanie. I'm fine.  
6 Thanks, Jon, and I'm still awake.

7 DR. SAMET: Okay. Great, and it's been a  
8 long time for you. We recognize.

9 Neal?

10 DR. BENOWITZ: No comments, Jon.

11 DR. SAMET: Okay. Thank you.

12 Let me ask if there are any other comments  
13 then before we come close to ending this session.  
14 I think I have a few remarks in closing, and then I  
15 guess we'll move to Bopper. So anything else?  
16 Tim? Yes?

17 DR. MCAFEE: First, I want to express the  
18 appreciation for somebody who is an ex officio  
19 government representative on the committee but did  
20 not have to take part in the actual work of  
21 producing the report. I want to thank the --  
22 although part of our job in terms of the CDC and

1 the other government members is that we all have to  
2 work over the ensuing years to actually deal with  
3 the recommendations of the committee, so you might  
4 not like my job a year from now.

5 But anyway, thank you very much for all the  
6 effort and thought you did on this very difficult  
7 and challenging area. And I just wanted to make  
8 one or two brief remarks about this and essentially  
9 redraw our attention to a point that I've made a  
10 couple times around this, which I think one of the  
11 things that was challenging about your job, that  
12 was essentially imposed because the interpretation  
13 of the regulatory framework, was the need to create  
14 a counterfactual model that essentially was  
15 predicated on the idea that menthol didn't exist or  
16 hadn't existed.

17 Therefore because of that, the modeling of  
18 what the world would look like that Dr. Mendez  
19 painstakingly put forward is in fact a  
20 conservative -- even given the use of the  
21 conservative assumptions, from a public health  
22 perspective, which is the other element that

1 Congress tasked FDA with, this is an extremely  
2 conservative estimate of the public health benefit  
3 of an actual taking menthol out of cigarettes  
4 because, in fact, if we look at the -- for  
5 instance, the model that David Levy used, which  
6 actually tried to estimate what would actually  
7 happen during a transition period relating to the  
8 role of menthol, the effects are much larger.

9 So even with the conservative model, which  
10 ends up with 40 to 60,000 deaths averted in African  
11 Americans and hundreds of thousands in the general  
12 population, these are clearly -- and actually I  
13 think, to the tobacco industry's credit, they  
14 actually acknowledged this in their executive  
15 summary and several of the statements that were  
16 made, which is removal of menthol cigarettes from  
17 the market plausibly would have some public health  
18 benefit. Removing any type of cigarette preferred  
19 by a substantial number of Americans might result  
20 in some smokers quitting when their preferred type  
21 of cigarette is taken away by the government.

22 So again, this may not be the primary

1       rationale from a regulatory perspective for why it  
2       would make sense or not make sense to take menthol  
3       out, but just as the industry is insisting that the  
4       FDA consider the essentially unanticipated side  
5       effects of the creation of a contraband market, I  
6       would encourage the FDA to, in its deliberations  
7       about what to do with this report, also take into  
8       consideration essentially the public health side  
9       effects that this move would have in the U.S.  
10      population and particularly for African Americans  
11      and youth, where the effect sizes will almost  
12      certainly be substantially larger than those that  
13      the committee used to make its decision.

14               Again, finally, I would just again echo the  
15      point, I think the committee, given its expertise,  
16      did the best job that it could over the issue of  
17      contraband and that this is something that clearly  
18      should be addressed in the FDA's consideration. I  
19      think it will be difficult to do, and most of the  
20      modeling that we heard about was based on price,  
21      data derived on price. And I think that it is not  
22      clear that that will be directly correlated with

1 menthol and that there are many other things that  
2 would be specific around this.

3 Be that as it may, the other issue is that  
4 this is again an area where I think in fact some of  
5 the interests of the tobacco industry and public  
6 health and FDA could potentially be aligned if this  
7 moves forward because, as has been noted, it is not  
8 in the interest of public health, governmental  
9 entities, et cetera, to see a large increase in  
10 contraband. But that is not a static mechanism,  
11 that there are many steps that government could  
12 take and the tobacco industry could take to  
13 markedly diminish what is really still a modest  
14 problem in our country, that the vast majority of  
15 cigarettes are still being purchased through legal  
16 mechanisms.

17 The only other thing that I think grated in  
18 this that is important to point out is it is a  
19 fundamental error to talk about legal versus  
20 illegal sales to minors. All sales to minors are  
21 contraband, period. So that should be off the  
22 table.

1           So I think looking at things that can be  
2       done around packaging at the manufacturing level  
3       that will make it easier for agents at the state  
4       and federal level to track this is well worth our  
5       attention, and it does not have to be an area where  
6       there is significant contention.

7           So again, thank you very much for your  
8       efforts over the past 10 meetings.

9           DR. SAMET: Thank you, Tim.

10          Patricia.

11          DR. NEZ HENDERSON: At the beginning of this  
12       meeting back in March of 2010, I used a phrase that  
13       on the Navajo nation we use when we talked about  
14       commercial tobacco, (speaking native language),  
15       meaning however you use commercial tobacco, it is  
16       harmful for you and everybody around you. And I'm  
17       very grateful today that this recommendation has  
18       been put together by our team, and that's all I  
19       wanted to say on behalf of the public.

20          DR. SAMET: Thank you, Patricia.

21          Dan.

22          DR. HECK: Just one quick follow-up. I

1       thank Dr. McAfee for reminding me of the point that  
2       is discussed in somewhat greater length in the  
3       industry report, and that is we're aware. We know  
4       that menthol cigarettes are preferred by a  
5       significant minority of smokers, about 30 percent  
6       overall, and predominantly preferred among the  
7       African-American community.

8               We don't need a model to project that the  
9       elimination of any segment of the tobacco product  
10      market would be projected to displease persons who  
11      favor those cigarettes, and I think light  
12      cigarettes are the biggest example by far, the most  
13      popular segment now.

14             But the industry's perspective there is that  
15      this is not the question we're about. The law, as  
16      I understand it as a non-lawyer, constrains the new  
17      regulatory authority from banning cigarettes,  
18      eliminating cigarettes totally, although the  
19      scientific basis for regulation does indeed empower  
20      FDA to regulate the content, emissions, product  
21      design elements and such.

22             So again, I don't think we need a model to

1 project the reality represented in the summary  
2 here, that any segment of the market, potentially  
3 eliminated or the what-if scenarios had it never  
4 existed or did not exist in the future, could  
5 probably be interpreted as having an affirmative  
6 public health benefit.

7 Just one point on that with regard to youth  
8 smoking or adult smoking for that matter, I want to  
9 remind FDA when we present this information to  
10 them, as has been presented before, we have  
11 examples around the world of many markets where  
12 menthol cigarettes effectively do not exist, a  
13 market share well below at 1 percent as it can be  
14 measured by the surveys in those countries.

15 We do not see low youth smoking or adult  
16 smoking. In fact, we see markedly higher youth  
17 smoking in many of those countries. We see that  
18 same pattern across the U.S. states as we've  
19 presented. The menthol market presence is  
20 inversely related in a modest but statistically  
21 significant way to youth smoking. So I think we  
22 should temper our expectations of the effect of one

1 regulatory scenario or another with the realities  
2 that are presented to us by real-world information,  
3 both internationally and from the states.

4 DR. SAMET: Thank you.

5 Any other comments? Tim?

6 DR. MCAFEE: I would fully concur with  
7 Dr. Heck's point that we do not think that  
8 eliminating menthol -- or if menthol were  
9 eliminated that that would be the end of the public  
10 health problems associated with tobacco use. But  
11 we are at a unique situation in the United States  
12 because of the prevalence of menthol is so high.  
13 And I think this is a very important point that Dr.  
14 Hatsukami laid out, that essentially the -- and  
15 this was interesting to me quickly reading your  
16 report because I saw it at the same time you did,  
17 that in fact the concern is in the trend, that  
18 although adolescent use and adult prevalence is  
19 declining, that the rate of decline is slower among  
20 menthol. So there appears to be something going on  
21 there.

22 DR. SAMET: Thank you.

1 Jack.

2 DR. HENNINGFIELD: Just very briefly on the  
3 international experience, which I think we learned  
4 from the international experience, and in turn  
5 other nations will learn from what is happening  
6 here, we know that overall rates of tobacco use and  
7 initiation are related to comprehensive tobacco  
8 control costs, social attitudes, history and so  
9 forth. So comparing the cross-nations in that  
10 sense, I don't think is necessarily useful. I  
11 think the important thing, though, is that there  
12 are many nations and regions where menthol use is  
13 extremely low, as you acknowledged, 1 percent or  
14 less, and there is not a huge contraband problem.  
15 And I think that's where it is important for FDA  
16 going forward to see why that is so low. Maybe the  
17 situation here would be a much lower contraband  
18 problem than has been predicted by some.

19 DR. SAMET: Thank you, Jack.

20 Let me just make sure that we have no more  
21 questions or comments. So I assume Neal and  
22 Melanie, nothing more from you?

1 DR. WAKEFIELD: I'm good. Thanks.

2 DR. BENOWITZ: Not from me.

3 DR. SAMET: Okay. And no one else. Well,  
4 very good.

5 So I actually have a few last concluding  
6 remarks. I think probably this moment in a year-  
7 long journey deserves at least a few closing  
8 comments. First, the report does have a name  
9 beyond the menthol report, and the title is Menthol  
10 Cigarettes and the Public Health: Review of the  
11 Scientific Evidence and Recommendations, a rather  
12 straightforward description of what the report is  
13 about.

14 I just wanted to remind everyone -- and I  
15 think the committee certainly is aware -- that this  
16 report reflects work done over 10 meetings that  
17 began almost a year ago. To use the cliché, it's  
18 been a long journey, and at least for TPSAC on this  
19 particular report, we will be done with any final  
20 editorial cleanup by March 23rd.

21 Just a few comments about the process over  
22 this year, I think for those of you who have

1 watched it, it has had many unique characteristics.  
2 It's been transparent. It's been open. We've  
3 posted our drafts and entered into a dialogue with  
4 many stakeholders on this important issue. We've  
5 had very helpful input from a variety of  
6 commenters, and on our request, materials have been  
7 made available from the tobacco industry.

8           TPSAC includes non-voting representatives  
9 from the tobacco industry, three colleagues,  
10 Arnold, John and Dan, and I think we've had a  
11 collegial and helpful dialogue with you, and we  
12 appreciate your input. And clearly you have very  
13 valuable and deep knowledge on this topic.

14           I think just some broad thanks. We've had  
15 many people who have brought comments to us from a  
16 variety of sectors ranging from the industry to  
17 various stakeholder groups and the public health  
18 community. A vast amount of scholarship has been  
19 done, I think much of it carried to support our  
20 activities; for example, the reviews of the tobacco  
21 industry documents, special issues to journals on  
22 the topic of menthol and so on. And these were

1       certainly valuable for us as we pursued our tasks.

2               So I want to thank all of those who have  
3 brought information to us and I think at the  
4 broader run of commenters who have made clear the  
5 societal importance of this issue and its  
6 importance to particular groups within the  
7 population.

8               FDA staff, I think you have to remember that  
9 about the time we got started on our report, FDA  
10 did not particularly have very many staff. And  
11 over the year since then, the FDA team has grown  
12 and I think always been extremely helpful to our  
13 efforts, and we thank all of you for your support.  
14 I don't think we've been too demanding a committee,  
15 actually, but you may see it differently. That  
16 will be an offline discussion.

17               We've had support from Denise Gellene, who  
18 helped us edit this document. This has been  
19 written quickly and taken support, needed editorial  
20 support, to bring it into shape. And that  
21 refinement will continue up to the last moment to  
22 deal with I think what are inevitable editorial

1 problems when a large document is produced  
2 relatively quickly.

3 David Mendez, we appreciate your work and  
4 effort in extending your prior work on tobacco  
5 modeling to include menthol. I think that work has  
6 provided a useful gauge as to the public health  
7 impact of menthol cigarettes.

8 I think last, to the committee, the writing  
9 committee. Jack, I don't know how you escaped not  
10 being on the writing committee, but I guess  
11 somebody had to have that job. But we appreciate  
12 of course your comments.

13 I think for those of us who have worked  
14 together on this report, it's been somewhat of a  
15 bonding experience, if you will. And there's been  
16 a lot of work in exchange and communication among  
17 us. So I appreciate all of your efforts. I think  
18 I know everyone has dug deep to get this done, and  
19 I think hopefully it shows in the quality of the  
20 report that we've produced.

21 We've had to digest and reach conclusions  
22 based on a very diverse body of evidence, a very

1 complicated set of scientific literature. And we  
2 needed to interweave these lines of science to  
3 reach the conclusions that there were, and I think  
4 that interweaving has taken a lot of thoughtful  
5 work on your parts, and I appreciate those efforts.  
6 So thanks to you all on the writing subcommittee.

7 So with that said, we've completed our  
8 tasks, and I think at this point the FDA has our  
9 findings and recommendations and suggestions. And  
10 we'll watch with interest what next steps you will  
11 take, as of course will many others. So let me  
12 turn things to Bopper.

13 DR. DEYTON: Mr. Chairman and really to the  
14 whole committee, as you know, I've attended all of  
15 your meetings, and it has been a very impressive  
16 process to watch, how this committee has handled a  
17 very difficult and complex task. And I think we  
18 all appreciate the amazing amount of work that has  
19 gone on.

20 By discussing and finalizing your report and  
21 recommendations, the committee is now near  
22 completion of your first charge under the Tobacco

1 Control Act, evaluating the available scientific  
2 evidence on the impact of the use of menthol in  
3 cigarettes and the impact on public health. So by  
4 completing your charge, it doesn't mark the end of  
5 a process. It does mean we've reached a very  
6 important milestone, though, today.

7 The Tobacco Control Act requires you to  
8 submit this report to FDA by March 23rd, and it  
9 looks like you will make that deadline. It has  
10 been a long year, and it's nice to be at that  
11 milestone. But I need to be very clear that the  
12 TPSAC final report is advice to FDA. The report  
13 does not set FDA policy. It does not set FDA  
14 actions, and FDA's receipt of the final report will  
15 not have a direct and immediate effect on the  
16 availability of menthol products.

17 Once the final report is received by FDA,  
18 obviously it will undergo thorough expert review by  
19 our staff. But FDA work will be to assess all of  
20 the science related to these issues as applied to  
21 the standards outlined in the Tobacco Control Act.  
22 Those include the population impact of menthol in

1 cigarettes; the risks and benefits to the  
2 population as a whole, users and nonusers alike.  
3 We'll examine effects on overall smoking initiation  
4 and cessation rates. And if considering any new  
5 product standards, we will assess the technical  
6 achievability and possible countervailing effects,  
7 such as creation of demand for contraband and the  
8 other issues that we've discussed here.

9 Now, although there is no required deadline  
10 or timeline for FDA to act on the issue of menthol  
11 in cigarettes, we do recognize the strong interest  
12 in this issue and will continue to communicate the  
13 steps FDA is taking as we undertake our work now as  
14 we determine what, if any, future regulatory  
15 actions are warranted.

16 We intend to provide our first progress  
17 report on our review of the science in  
18 approximately 90 days. Ultimately, FDA's decision  
19 whether to implement any of the report's  
20 recommendations will be driven first and foremost  
21 by our commitment to reduce the toll of disease,  
22 disability and death caused by tobacco in the U.S.

1 and the requirements of the Tobacco Control Act.

2 So on behalf of Commissioner Hamburg and all  
3 of us here at the Center for Tobacco Products, I  
4 want to thank each member of TPSAC for all the  
5 time, the expertise, and the effort that you have  
6 put into this important process over the last year.  
7 I also want to thank members of the public who've  
8 attended these meetings and who have offered their  
9 very helpful comments. But now it's up to us to do  
10 our job, and I want to thank you for doing yours.

11 **Adjournment**

12 DR. SAMET: Thank you, Bopper, and we will  
13 obviously watch with interest. I think we don't  
14 have a TPSAC meeting until July, and so we will  
15 have a -- I think this is a TPSAC vacation almost,  
16 and we look forward to it.

17 So again, thank you, and as Bopper pointed  
18 out, we've done our first task. I guess others  
19 await us, as we know. So meeting adjourned.

20 (Whereupon, at 9:21 a.m., the meeting was  
21 adjourned.)  
22
